

From Stress to Success Solving Math Word Problems

Todd Evans

LITERACY FOR LIFE | 1 NOVEMBER 2014

What Do You See?

Teaching Strategies for Word Problems

- Providing Context for Math
 - Math biography, surveys, and writing activities
 - Giving math problems a context
 - Writing math problems
- Reading Comprehension
 - Active reading strategies
 - Graphic organizers
- Critical Thinking/ Reasoning
 - Think Aloud technique
 - Brainteasers/ Fermi questions
- Eliminating Barriers
 - Early introduction
 - Simplifying
 - Aids

Accessibility

- Small books
- Small amounts of information
- Clearly written
- Simple explanations
- Easy to follow examples

EQUIVALENT FRACTIONS

Reducing Fractions Equivalent fractions are fractions that have equal value. You can use multiplication and division to find equivalent fractions. Sometimes you want to reduce a fraction so it is written in lowest terms. When a fraction is in lowest terms, there is no number other than 1 that can be divided evenly into the numerator and denominator.

If the 10 members in a book club, 8 people live in the same neighborhood. In lowest terms, what fraction of the members lives in the same neighborhood?

1. Write a fraction: $\frac{8}{10}$ out of 10 = $\frac{8}{10}$

2. Find the greatest common factor of both numbers: 2. Factors of 8: 1, 2, 4, 8

3. Divide the numerator and denominator by the greatest common factor: Factors of 10: 1, 2, 5, 10
 $\frac{8 \div 2}{10 \div 2} = \frac{4}{5}$

In lowest terms, the fraction $\frac{8}{10}$ is equal to $\frac{4}{5}$.

Adding Fractions There are times when you need to express a fraction in higher terms. You can use a fraction to find an equivalent fraction.

Which fraction is greater: $\frac{2}{5}$ or $\frac{3}{7}$?

1. Find the least common denominator for both fractions. Start by finding the multiples of the greater denominator. Look for multiples of both denominators. Multiples of 5: 5, 10, 15, 20, 25
 15 is also a multiple of 3.
 The least common denominator of 3 and 5 is 15.

2. Multiply to find equivalent fractions with common denominators.
 $\frac{2}{5} = \frac{2 \times 3}{5 \times 3} = \frac{6}{15}$ $\frac{3}{7} = \frac{3 \times 2}{7 \times 2} = \frac{6}{14}$
THINK: 5 times what is 15? 3 times what is 15?

3. Now you can compare the fractions with the same denominator.
 $\frac{6}{15} < \frac{6}{14}$ So $\frac{2}{5} < \frac{3}{7}$

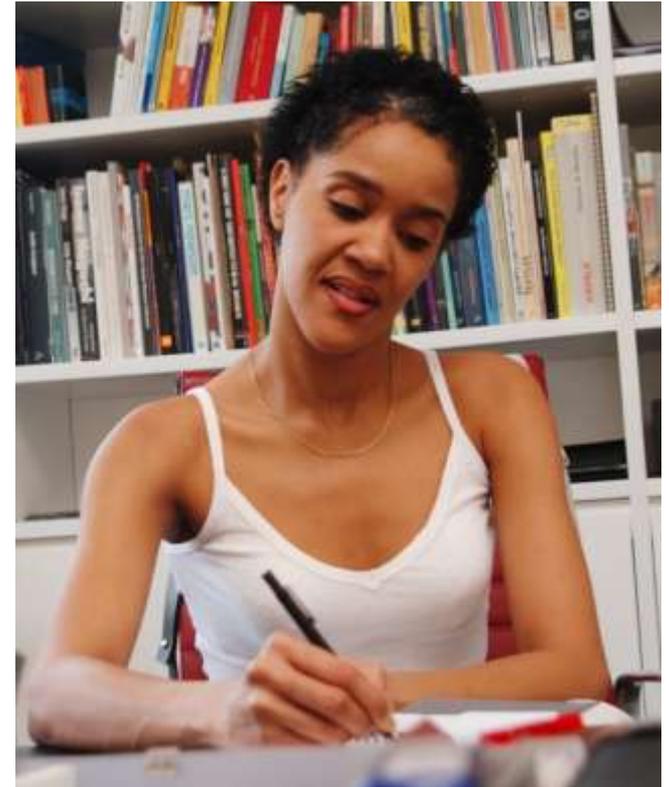

If two fractions are equivalent, the cross products are equal.
 $\frac{3}{5} = \frac{6}{10}$ $3 \times 10 = 40$ $6 \times 5 = 30$
 $6 \times 10 = 60$ $3 \times 5 = 15$

GED Skill Workbook
Mathematics 1

Math Biographies, Surveys, & Writing Activities

- Overcome negative feelings toward problem solving
- Become familiar with seeing math problems expressed in words
- Connect math concepts to real world experiences
- Transfer everyday problem solving skills to solving word problems

Math Biography

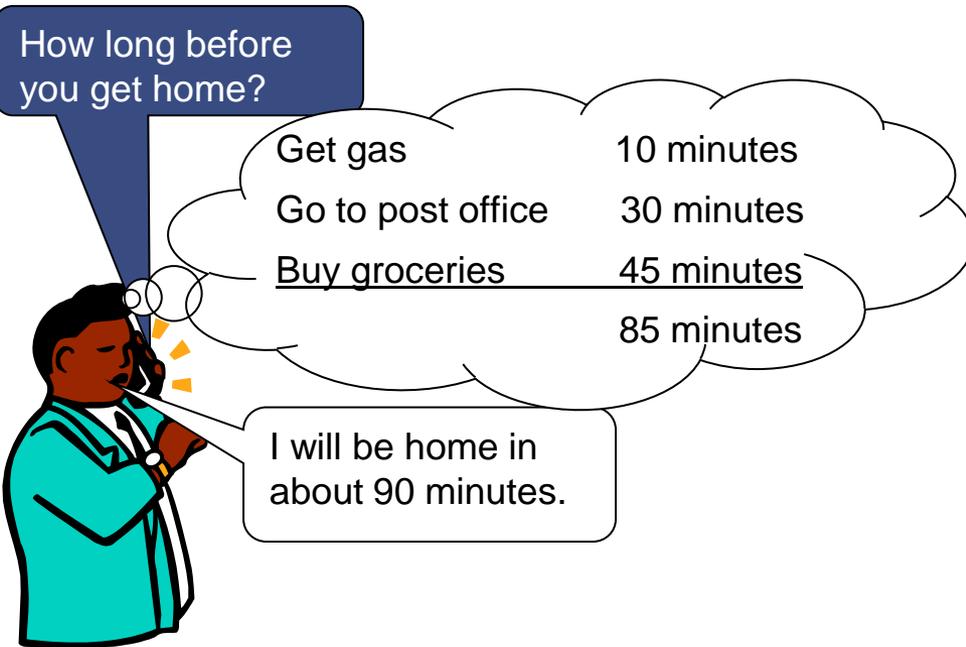

- Do you like math?
If no, when did you start to dislike math?
- With what kind of math problems do you feel most confident?
- With what kind of math problems do you feel least confident?
- What do you want to learn in math that could help you in your life?

Math Survey

- Each of the following situations involves a fraction, decimal, percent, or ratio. Check off any experiences you've had.
 - Following a recipe
 - Figuring out mileage
 - Determining a sales price
 - Using a measurement tool such as a ruler
 - Reading percents in a newspaper article
 - Paying for something with coins
 - Using the metric system for measurement
- Describe the last time you used fractions when measuring something.
- Where have you seen the word percent or the symbol %?
- When was the last time you used digital measurement?
- You use money everyday. With a partner, list other places that you see decimals.

Math Survey

How long before you get home?

Get gas	10 minutes
Go to post office	30 minutes
<u>Buy groceries</u>	<u>45 minutes</u>
	85 minutes

I will be home in about 90 minutes.

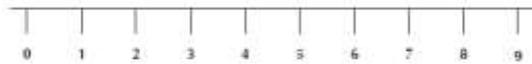

Have you ever had a similar experience?
Write about it.

Providing Context

- Ask students to provide a context for the problems they solve
- Ask students to share context when reviewing in class

Exercise 1

Subtract these numbers.
Use the number line if you want.

0 1 2 3 4 5 6 7 8 9

1. $\begin{array}{r} 7 \\ -3 \\ \hline \end{array}$	6. $\begin{array}{r} 3 \\ -4 \\ \hline \end{array}$
2. $\begin{array}{r} 9 \\ -6 \\ \hline \end{array}$	7. $\begin{array}{r} 3 \\ -2 \\ \hline \end{array}$
3. $\begin{array}{r} 6 \\ -3 \\ \hline \end{array}$	8. $\begin{array}{r} 8 \\ -4 \\ \hline \end{array}$
4. $\begin{array}{r} 7 \\ -2 \\ \hline \end{array}$	9. $\begin{array}{r} 2 \\ -1 \\ \hline \end{array}$
5. $\begin{array}{r} 6 \\ -3 \\ \hline \end{array}$	10. $\begin{array}{r} 4 \\ -3 \\ \hline \end{array}$

Answers for Exercise 1 are on page 62.

10 Subtracting Numbers

Providing Context

- $18 \times 8 =$

- $(p + \frac{1}{2} p) n =$

- $\frac{1}{2} + \frac{1}{4} + \frac{1}{4} =$

- Circumference of a circle with radius 3

Writing Word Problems

- Work in pairs
- Make up and write a math problem
 $10 \div 2 = 5$
- Trade math problems with your partner
- Make up a context for your partner's problem
 $\$10 \div 2 \text{ people} = \5 each
- Write a word problem for your partner's problem
- Exchange problems with other pairs

Active Reading Strategies

- Circling Numbers
- Underlining key phrases
- Rereading a problem
- Restating the problem in your own words
- Thinking of a similar problem
- Studying a graph or diagram before reading the problem
- Drawing a graph or diagram of the problem

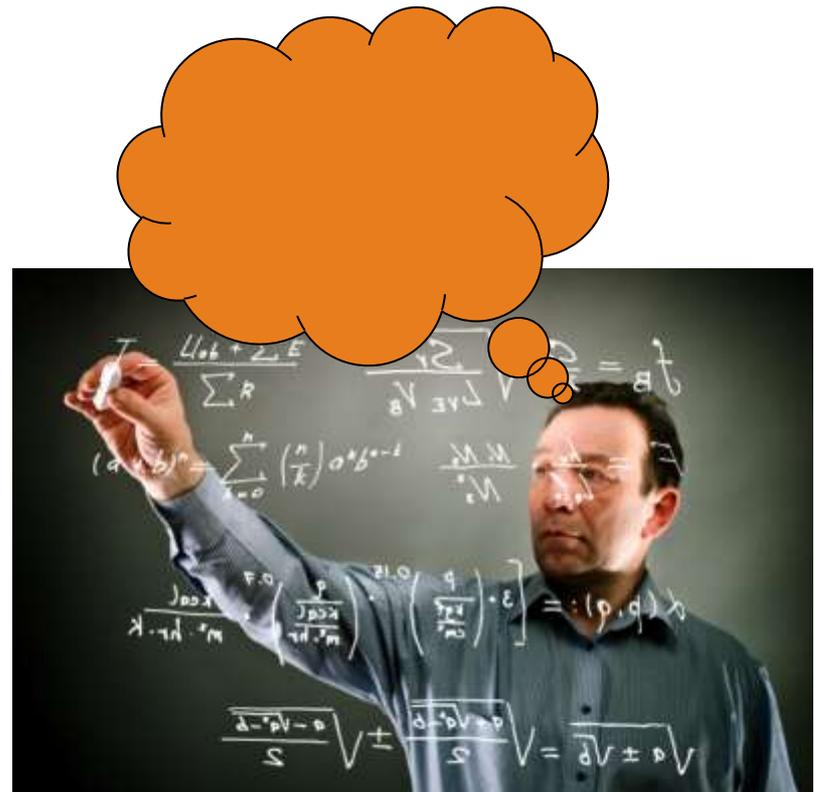

Problem Solving Graphic Organizer

- Consistently apply problem solving process
- Writing responses helps students understand their thinking process

Problem Solving	
What am I trying to find?	I am trying to...
What is the information (with labels) in the problem?	The important information is...
Identify information you think is necessary and information which you may not need.	This information is not important because...
What operation will I use?	To solve the problem, I will...
Solve the problem.	First I... Next I... Finally I...
Check my answer: Did I answer the question?	The answer is... I was asked to...
Does my answer make sense?	This answer makes sense because...

Think Aloud Technique

- Carefully select problem
- Review problem and select strategies
- Put problem in own words
- Model strategies
- Identify and discuss strategies
- Give students problem

Think Aloud Technique

A department store advertises a clearance sale that offers "Take an additional 40% off the sale price." A coat that was originally \$75 is on sale for \$50.00. What is the clearance price?

- 1) \$20.00
- 2) \$25.00
- 3) \$30.00
- 4) \$40.00
- 5) \$45.00

What am I being asked to find?	I am trying to find the clearance price of the coat.
--------------------------------	--

Think Aloud Technique

A department store advertises a clearance sale that offers "Take an additional 40% off the sale price." A coat that was originally \$75 is on sale for \$50.00. What is the clearance price?

- 1) \$20.00
- 2) \$25.00
- 3) \$30.00
- 4) \$40.00
- 5) \$45.00

What is the information (with labels) in the problem?

Identify information you think is necessary and information which you may not need.

The important information is

\$50 Sale price of coat

40% off sale price

The \$75 original price of coat is not important because the discount is on the sale price

Think Aloud Technique

A department store advertises a clearance sale that offers "Take an additional 40% off the sale price." A coat that was originally \$75 is on sale for \$50.00. What is the clearance price?

- 1) \$20.00
- 2) \$25.00
- 3) \$30.00
- 4) \$40.00
- 5) \$45.00

What operations will I use?

To solve the problem, I will find the discount (40% off sale price).
 $40\% \times \$50 = \text{discount}$

Next I will find the clearance price.
 $\text{Sale price} - \text{discount} = \text{clearance}$

Think Aloud Technique

A department store advertises a clearance sale that offers "Take an additional 40% off the sale price." A coat that was originally \$75 is on sale for \$50.00. What is the clearance price?

- 1) \$20.00
- 2) \$25.00
- 3) \$30.00
- 4) \$40.00
- 5) \$45.00

Solve the problem.

First I multiply $.40 \times 50 = 20$ (\$20)

Then I subtract $\$50 - \$20 = \$30$

Think Aloud Technique

A department store advertises a clearance sale that offers "Take an additional 40% off the sale price." A coat that was originally \$75 is on sale for \$50.00. What is the clearance price?

- 1) \$20.00
- 2) \$25.00
- 3) \$30.00
- 4) \$40.00
- 5) \$45.00

Check my answer.
Did I answer the question?

Does my answer make sense?

This answer is ~~\$20~~. sense. Since it is an additional discount, I was asked to find the clearance price. I should be less than \$50. Since the 40% from the sale price of \$50 (\$20) is not quite half off, the final price should be a little more than half subtracted that amount from \$50 to get the clearance price.

Think Aloud Technique

Susan has five bills in both \$5 and \$10 denominations. If the total value is \$35, how many are \$5 bills?

A sign pole casts a 6-foot shadow. At the same time of day, a 4-foot child casts a 3-foot shadow. What is the height of the pole in feet?

Brain teasers

- How many one-eighth-inch marks are there on a yardstick?

How many one-eighth-inch marks are there on a yardstick?

- 288
 - There are 8 marks per inch. $8 \times 36 = 288$
- 144
 - Only the marks at $\frac{1}{8}$, $\frac{3}{8}$, $\frac{5}{8}$ and $\frac{7}{8}$ are $\frac{1}{8}$ -inch marks. The others are marks for quarter, half, and whole inches. So, there are 4 marks per inch. $4 \times 36 = 144$
- 36
 - The $\frac{3}{8}$ -inch mark is not a $\frac{1}{8}$ -inch mark. So, there is one mark per inch.
- 1
 - The mark at $1 \frac{1}{8}$ is a $1 \frac{1}{8}$ -inch mark. So there is only one $\frac{1}{8}$ -inch mark.

Important Questions

- What are the relevant facts in this question?
- Can the question be interpreted in any other way?
- Are there any terms that are unclear or ambiguous?
- What is the larger context (big picture) for understanding this question?
- What insights into your own thinking can you draw from answering this question?
- What assumptions are implied by your answer to this question?
- What process did you use in answering this question?
- What is most important to you in this question? Why?
- How did your values impact how you answered this question?
- Are you pulled in different directions about how to answer this question? Why or why not?

Brainteasers

- How can you add eight 8's to get the number 1,000? (only use addition)
 - The key to this math riddle is realizing that the ones place must be zero.
 $888 + 88 + 8 + 8 + 8 = 1,000$

Fermi Questions

- Estimation questions that help students develop critical thinking and problem solving skills
- How many piano tuners are there in Chicago?

Fermi Questions

- 5,000,000 people living in Chicago.
- Two persons in each household
- One household in twenty has a piano that is tuned regularly.
- Pianos are tuned once a year.
- Two hours to tune a piano, including travel time.
- Piano tuner works eight hours in a day, five days in a week, and 50 weeks in a year.
- Piano tunings per year
 - $(5,000,000/2) / 20 = 125,000$
- Average number of jobs a piano tuner performs
 - $(8 \times 5 \times 50) / 2 = 1,000$
- Number of piano tuners in Chicago
 - $125,000 / 1,000 = 125$

Eliminating Barriers

- Early introduction to word problems
- Simplify word problems

Simplify Word Problems

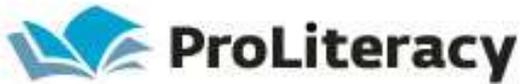

Jan is using a cake that calls for the following liquid ingredients: $\frac{1}{3}$ cup cooking oil, $1\frac{1}{4}$ cups buttermilk, $\frac{1}{8}$ cup water. How many cups of liquid will she use to make the cake?

Jan is using a cake that calls for the following liquid ingredients: $\frac{1}{2}$ cup cooking oil, $\frac{1}{4}$ cup buttermilk, $\frac{1}{4}$ cup water. How many cups of liquid will she use to make the cake?

Eliminating Barriers

- Early introduction to word problems
- Simplify word problems
- Aids

Math Aids

Lance worked $6\frac{1}{4}$ hours on Monday and $4\frac{7}{8}$ hours on Tuesday. How many total hours did Lance work?

Adding Mixed Numbers

Problem	$6 \frac{1}{4} + 4 \frac{7}{8}$
1. Do the fractions have the same denominator?	Yes <input checked="" type="radio"/> No
1a. If no, find a common denominator and rewrite the numerators.	$\frac{1}{4} = \frac{2}{8}$ $\frac{7}{8} = \frac{7}{8}$
2. Find the sum of the fractions (not the whole numbers)	$\frac{2}{8} + \frac{7}{8} = \frac{9}{8}$
2a. Can you simplify the sum of the fractions?	Yes <input checked="" type="radio"/> No
2b. If yes, write the fraction in the simplest terms.	

Adding Mixed Numbers

Problem	$6 \frac{1}{4} + 4 \frac{7}{8}$
3. Is the sum of the fractions (2b) greater than or equal to 1?	Yes No
3a. If yes, convert the fraction to a mixed number and write it here..	$\frac{9}{8} = 1 \frac{1}{8}$
3b. Find the sum of the whole numbers in the original problem plus any whole number from 3a and write it here.	$6 + 4 + 1 = 11$
4. Combine the sum in 3b with the fraction from 3a.	$11 \frac{1}{8}$
